Warranty information

Limited warranty

Unless otherwise stated, your product is covered by a one (1) year parts and labor limited warranty. It is the owner's responsibility to furnish receipts or invoices for verification of purchase, date, and dealer or distributor. If purchase date cannot be provided, date of manufacture will be used to determine warranty period.

Returning under warranty

Any Product unit or parts returned to Luminex LCE must be packaged in a suitable manner to ensure the protection of such Product unit or parts, and such package shall be clearly and prominently marked to indicate that the package contains returned Product units or parts. Accompany all returned Product units or parts with a written explanation of the alleged problem or malfunction.

Freight

All shipping will be paid by the purchaser. Items under warranty shall have return shipping paid by the manufacturer only in the European Union. Under no circumstances will freight collect shipments be accepted. Prepaid shipping does not include rush expediting such as air freight. Air freight can be sent customer collect in the European Union.

Warranty is void if the product is misused, damaged, modified in any way, or for unauthorized repairs or parts.

General

Packaging

- 1 x Ethernet – DMX8
- 1 x User guide

Description

The Ethernet - DMX8 is an Ethernet node that serves 8 DMX512 outlets, compatible with the ArtNet protocol.

All 8 outlets are conform to RDM and can be used as input or output. The Ethernet link is a 10/100BaseT (auto detect) connection on a Neutrik RJ45 Ethercon connector.

All configuration can be done over Ethernet through a built in website, or by using the controls on the front end. A bright blue LCD with white text and 5 navigation keys are provided to control the unit.

This all comes in a 19" 1 unit high metal housing.

Specification

Model: Ethernet - DMX8

Manufacturer: LUMINEX Lighting Control Equipment

• **Dimensions**

482 x 172 x 44 (mm)

19" x 6,8" x 1,75"

Package: 520 x 235 x 50 (mm)

• **Weight**

2,2 kg

• **Electrical**

Voltages: 90 – 260 VAC

Frequency: 47 – 63 Hz

Rated power: 20 W

Fuses: 125V, 500mA, Slow blow only (5mm x 20mm)
250V, 315mA, Slow blow only (5mm x 20mm)

• **Connectors**

1 x Neutrik RJ45 Ethercon connector

8 x Neutrik gold plated 5 pin XLR (female)

• **Environmental**

Operating temperature: 0 ~ 60°C (32 ~ 140°F)

Connectivity

Rear panel

- **Mains**

The device operates with an AC voltage between 90V and 260V within a frequency range of 47Hz and 63Hz.

A fixed power lead with loose cable end is directly connected to the device (no plug/connector). Please use an authorized plug and connect the cores in the mains lead in accordance with the following scheme:

Green / Yellow: Earth
Blue: Neutral
Brown: Live

!!! This equipment must be earthed !!!

- **DMX input / output**

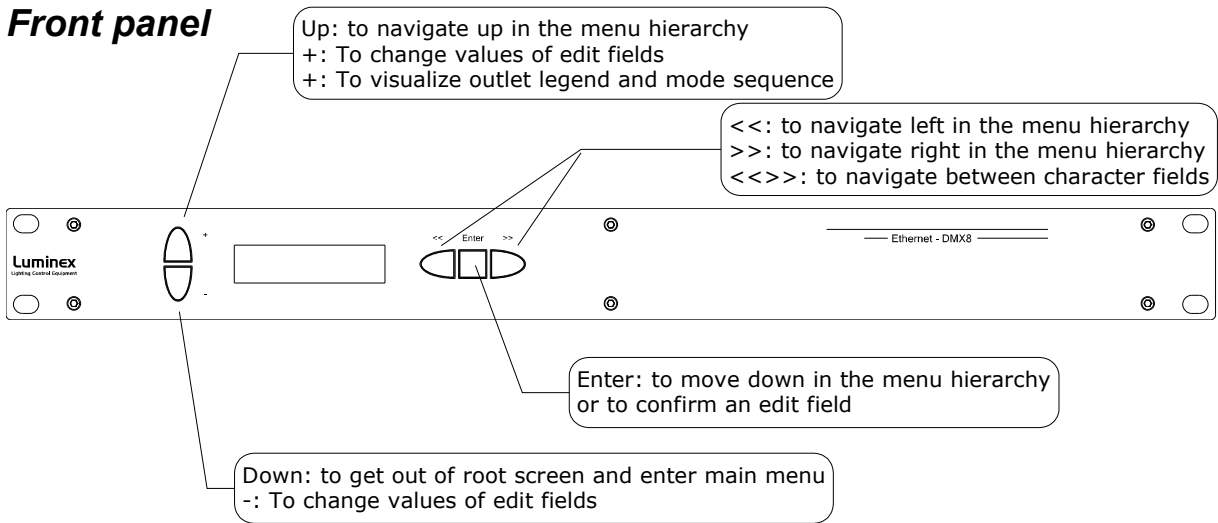

8 Neutrik 5 pin gold plated female connectors are provided as outlet (input or output).

Connector	Function
Pin 1	Signal common (0 volt)
Pin 2	Data complement (-)
Pin 3	Data true (+)
Pin 4	Not used
Pin 5	Not used

All outlets are compliant with the DMX512-A timing specification and are terminated and rebiased.

Interface

Front panel

The front panel interface is provided with 5 navigation buttons and a bright blue 2 lines, 16 character LCD.

All settings and setup explained in this chapter can also be made by using the built in web pages. See Web interface chapter at page 24.

Four indication screens will rotate continuously on the display with an interval of a few seconds. The unit also returns to these root screens when no button is pressed for 2 minutes.

You can visualize the screen of your choice by simply pressing the right arrow button (>>).

Another indication screens sequence is also available by pressing up arrow button or "+". This sequence displays all outlets legend and mode. This can be very useful for a technician who just need to know what is connected to a dedicated outlet. This sequence is available even if the node is password protected through Web interface.

To get in the configuration menus and to setup the device, press the arrow down or “-” button.

An arrow left or right (<>) in the screen indicates the possibility to navigate with the left right buttons of the front end.

- **Unlock the node**

When the node is set in auto-lock mode or is password protected through the Web interface, it will automatically lock the front end after 2 min of inactivity of front end controls. If you try to change something with front end, the following message “DEVICE LOCKED” will blink.

To unlock the node with no password :

- Hold down up and down arrow button for 2 seconds
- A “HOLD TO UNLOCK” message appears
- “DEVICE UNLOCKED” : the node is unlocked

To unlock the node set with a password :

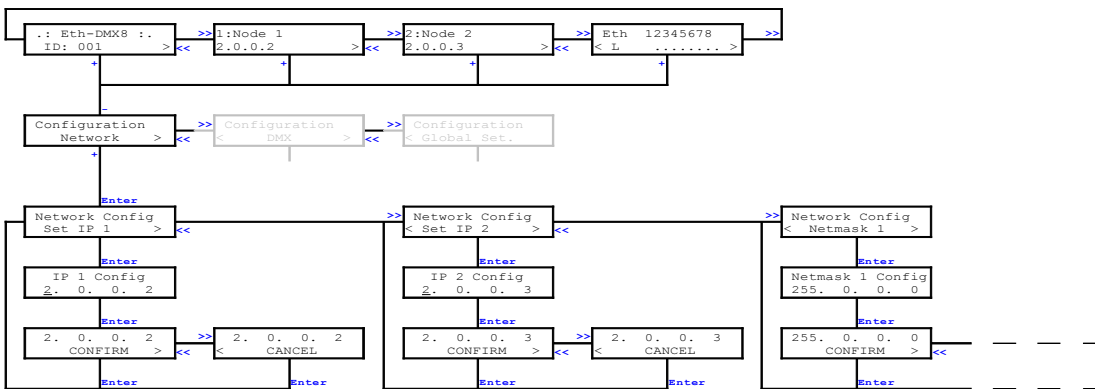

- Hold down up and down arrow button for 2 seconds
- Password has to be set with left and right buttons, change value with up and down buttons.
- Press enter to confirm the password=> the node is unlocked

- **Reset the node (Out of jail)**

This useful function makes it possible to bring the node in a factory default.

1. Power down the unit.
2. Hold down up, down, left and right buttons all together
3. Power on the node.
4. Wait until “Reboot default” message is displayed
5. Release buttons, then press enter to confirm
6. “FACTORY RESTART !! WAIT !!” is displayed
7. The node is now in a factory default: IP: 2.0.0.2 / 2.0.0.3

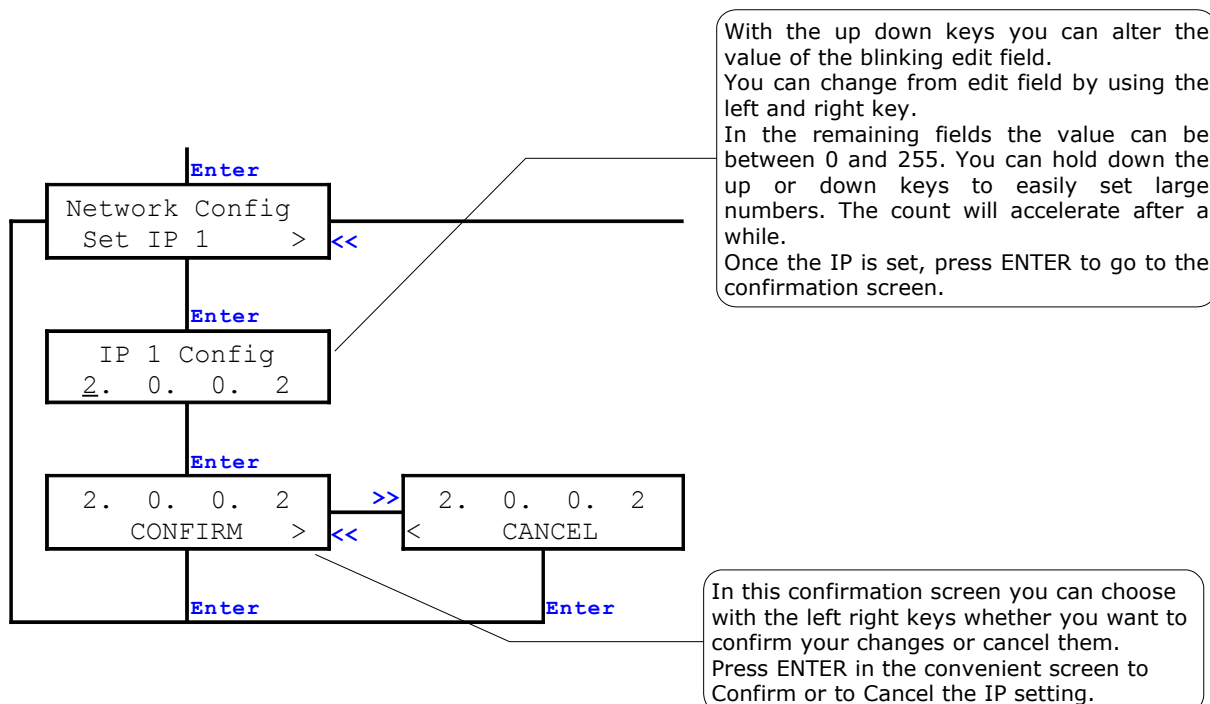

● Network configuration

IP setting

The device uses ArtNet as protocol to distribute multiple DMX lines over Ethernet. Because of the ArtNet specification, the number of outlets is limited to 4 (4 inputs and / or 4 outputs) per node. The Ethernet – DMX8 however has 8 outlets. That is why the device uses 2 IP addresses. There are virtually 2 ArtNet nodes running on this one device. This allows us to serve 8 outlets, 4 for every node. Because an ArtNet node is known by its IP address on a network, we have to provide 2 unique IP addresses (IP 1 and IP 2). However, this provides you to the opportunity to run 2 separate networks on the same device.

From *Configuration network* press **Enter** to get into *Network Config, Set IP 1*. Here you can use the left, right keys to choose to configure IP 1, IP 2 or UDP port. Choose *Set IP 1* and press **Enter**. The IP edit screen appears with the first digit blinking. The following procedure is similar for IP 2.

UDP ports setting

The UDP ports are used to indicate the Ethernet ports number on which the network socket has to listen for ArtNet data. 2 UDP ports are available on the node, 1 for four universes. These numbers are indicated in Hex value and the default is 0x1936. These values may only be changed by an experienced network administrator.

- **DMX configuration**

Every DMX outlet can be configured separately as input or output. These inputs and outputs get a DMX line address on ArtNet. It is possible to distribute 256 different DMX lines over ArtNet.

The Ethernet – DMX8 runs 2 ArtNet Nodes with outlet 1 to 4 on Node 1 and outlet 5 to 8 on Node 2. Some settings of the DMX outlets are dependent on the Node setting.

The DMX line address (Universe) on ArtNet is a combination of the outlet's Subnet and Subswitch. The Subnet divides the possible range of 256 addresses in groups of 16 addresses. Every outlet has one Subnet setting (from 0x0 – 0xF, 0- 15). And every outlet has a separate Subswitch (from 0x0 – 0xF, 0 – 15). Combined this gives the following result.

The Subnet is the high nibble of the complete address and the Subswitch is the low nibble of the address.

Outlet 1:

In decimal this would be:

$$\text{Result} = (\text{Subnet} \times 16) + \text{Subswitch}$$

$$\text{Result address} = (2 \times 16) + 12 = 44$$

Happily, if you're not used to work on hexadecimal values, the node allows you to set you outlet DMX line in decimal value. The corresponding hexadecimal value will be displayed in brackets.

Example:

```
Outlet : 1
Univ:   0 (00)
```

Outlet route

➤ DMX output

To setup an outlet as output, follow the following procedure.

Choose **DMX Config**, **Outlet route** press **Enter** and select the outlet with the left right keys.

Enable	
Yes	Enables the outlet
No	Disables the outlet

Dir (Direction)	
Output	Sets the outlet as DMX output
Input	Sets the outlet as DMX input

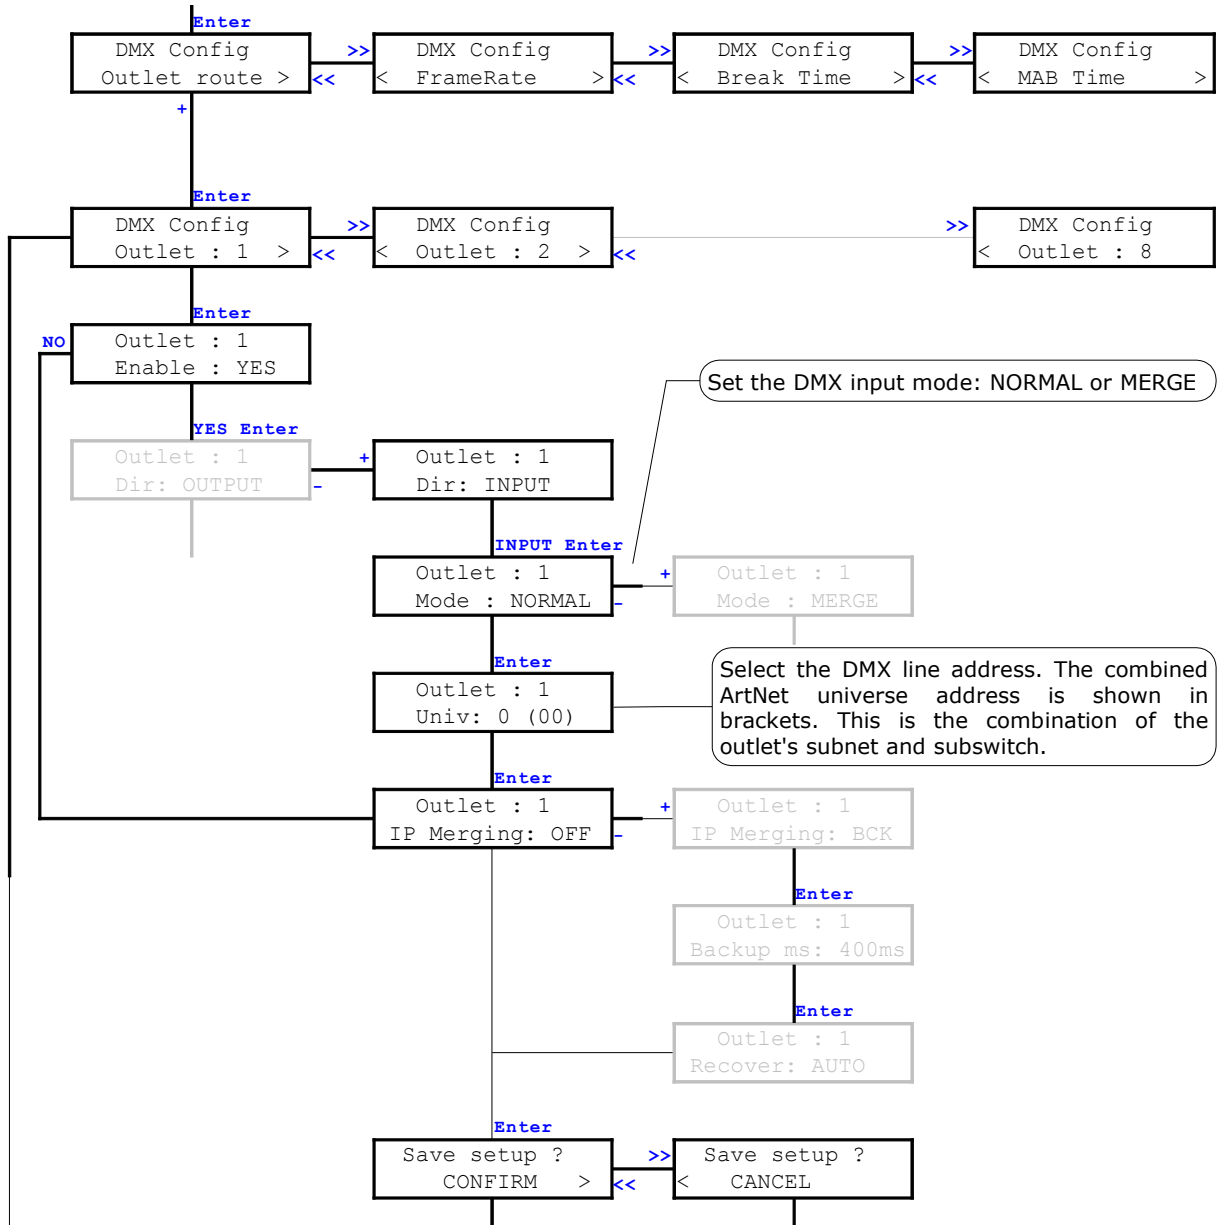

Mode (output)	
Single	The DMX outlet outputs normal DMX data coming in over ArtNet.
Zero	DMX outlet outputs DMX data with all zero values for all 512 channels.

Univ (Universe)	
Sets the outlet's DMX line address. ArtNet Hexadecimal value is available in brackets	

<i>IP Merging</i>	
OFF	Disable the IP merging feature
HTP	Merge 2 ArtNet streams set with same universe address; All channels outputted from that outlet will result of a Highest Take Precedence policy between the two first registered ArtNet sources.
LTP	Merge 2 ArtNet streams set with same universe address; All channels outputted from that outlet will result of a Last Take Precedence policy between the two first registered ArtNet sources.
CUSTOM	Need the use of a Web browser. Create here a complete softpatch, select the 2 ArtNet sources IP addresses and universe addresses to merge. You can affect each kind of merging policy (HTP, LTP, Backup, S1 only, S2 only..) on each channel of the selected outlet. You can also set here the Trigger channel to remotely change theses policies through DMX.

➤ DMX input

To setup an outlet as input, follow the following procedure.
 Choose **DMX Config**, **Outlet route** press **Enter** and select the outlet with the left right keys.

Enable	
Yes	Enables the outlet
No	Disables the outlet

Dir (Direction)	
Output	Sets the outlet as DMX output
Input	Sets the outlet as DMX input

Mode (input)	
Normal	The DMX outlet works as a normal DMX input putting data on ArtNet.
Merge	The outlet will be merged with the next outlet. This option is only available for outlet 1, 3, 5 and 7. When this mode is chosen, the next outlet is automatically set as input. Merge policies can be set by configuring the next outlet. (see Merged DMX input)

Univ (Universe)
Sets the outlet's Subswitch to complete the complete universe, or DMX line address of the normal input or the merge result.

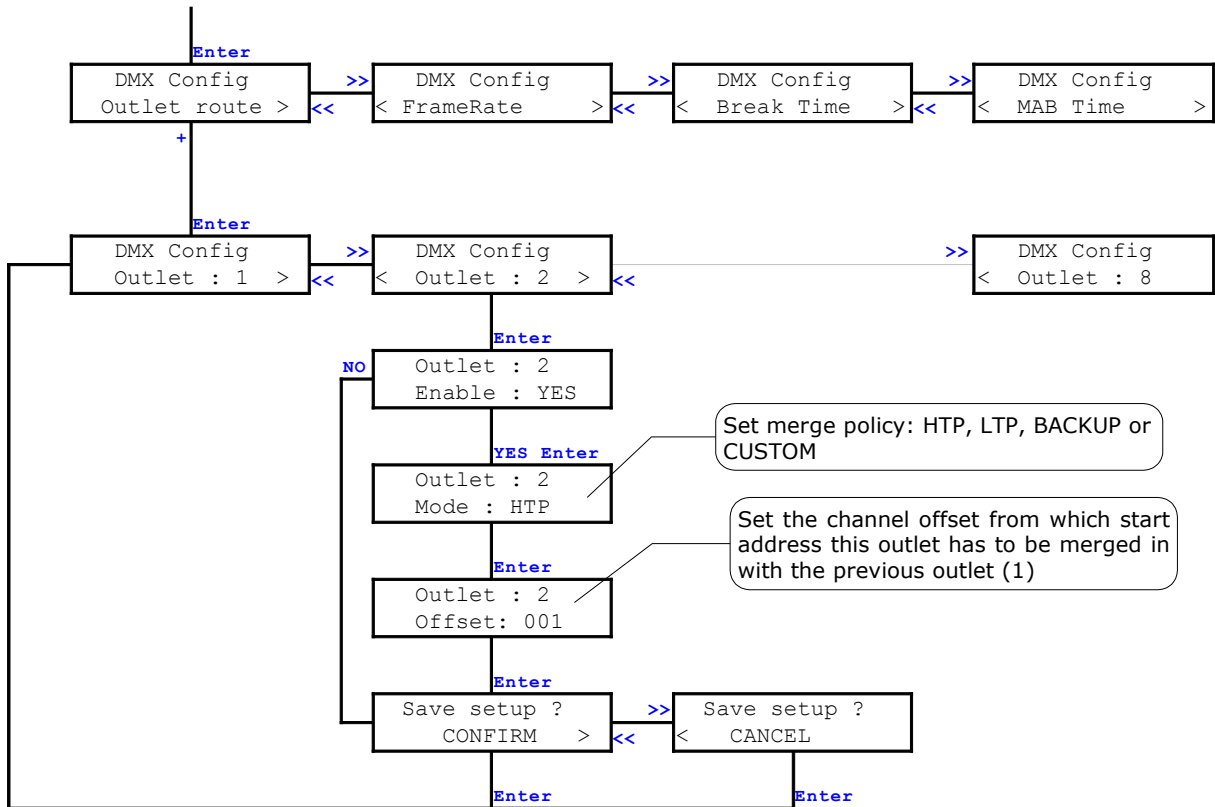

IP Merging	
Off	The DMX outlet works as a normal DMX input putting data on ArtNet.
Bck	The outlet act as networked backup input. It will function as a input backup of the main ArtNet source set with the same universe address. When invalid or no DMX is received from the primary ArtNet source, this outlet will automatically take over. The primary source takes over again as soon as valid data is available again

Backup ms
Set here the time within the node as to wait before switching to the backup outlet (from 400 to 9999ms) in case of primary ArtNet source stream failure.

Recover	
Auto	If the failed ArtNet stream is back again on the network, the node will switch back automatically to this previous ArtNet source, and thus disable the backup outlet.
Manual	The node will not switch back automatically to the previous ArtNet stream. You'll have to switch yourself to the previous ArtNet stream by using the recover channel patched in the enabled trigger universe. See page 28

➤ Merged DMX input

If one of the odd outlets (1, 3, 5 or 7) is set as merged input, then the corresponding even outlet (2, 4, 6 or 8) is automatically set as input. For this input you have to configure the merging policy and start address offset (for HTP and LTP only).

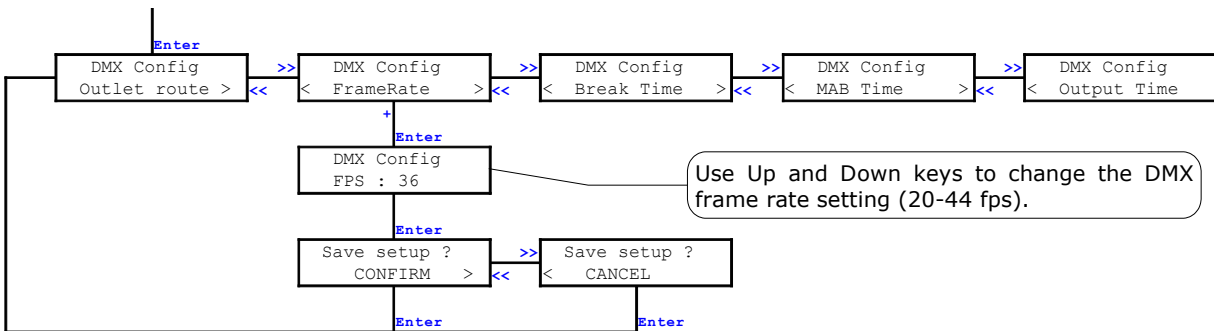

Enable	
Yes	Enables the outlet
No	Disables the outlet

Mode (merged)	
HTP	Merges the channels from this outlet starting at the offset into the previous outlet input, using Highest Takes Precedence (HTP) policy. The highest value of 2 merged channels will be used.
LTP	Merges the channels from this outlet starting at the offset into the previous outlet input, using Latest Takes Precedence (LTP) policy. The latest changed values will end up in the merge result.
BACKUP	This outlet will function as a input backup of the previous outlet. When invalid or no DMX is received on the primary (previous) outlet, this outlet will automatically take over. The primary outlet takes over again as soon as valid data is available again.
CUSTOM	This mode requires the use of a Web browser. It is the most complete one as all policies listed above are available for each channel. A complete softpatch can thus be created by using the table available through the built-in Web server. See page 28 for more details.

Offset	
Sets the offset address of where the merging of the second outlet has to start. This option is not applicable in BACKUP and mode.	

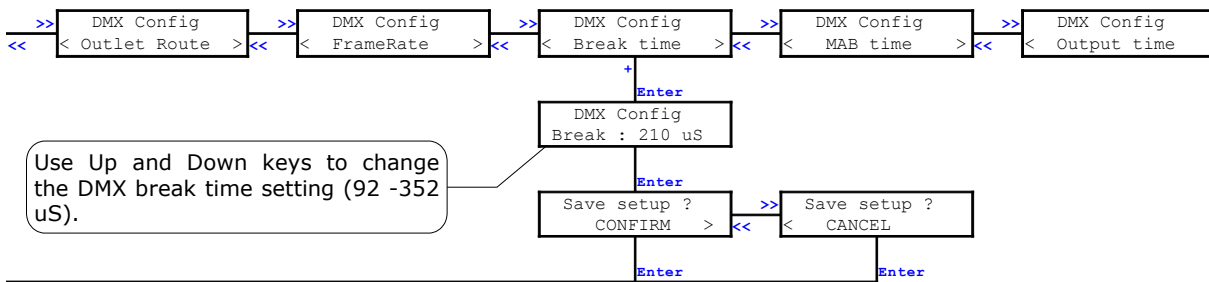

Frame rate setting

The frame rate setting determines the DMX refresh rate. The refresh rate is set for all outlets similar. The frame rate can be set from 20 to 40 FPS (Frames Per Second).

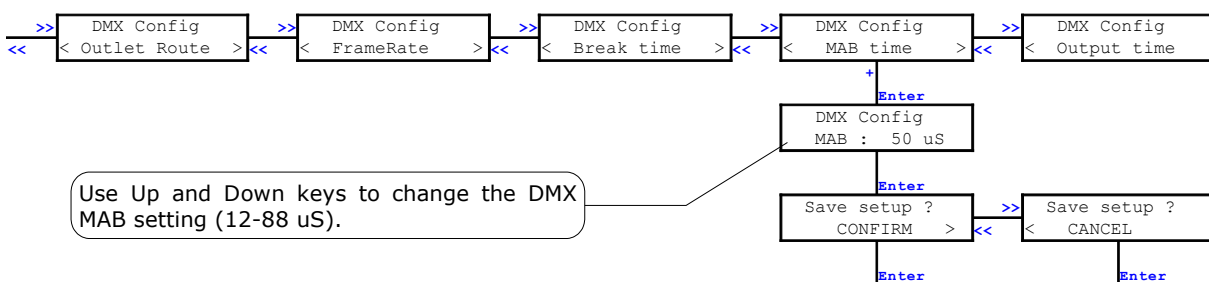

Break time setting

The break time of the DMX signal can be set from 92 – 352 us. This is the idle time between 2 DMX packets of 512 channels.

Mark After Break (MAB) time setting

The MAB time of the DMX signal can be set from 12 – 88 us. This is the time after the idle time to indicate a new DMX packet start.

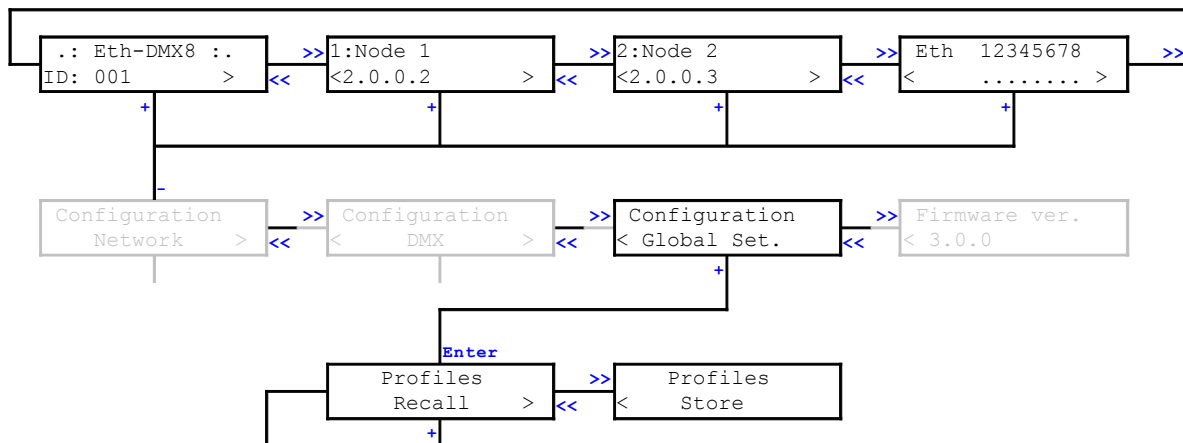

DMX output time setting

The DMX output time is used to set the amount of time an output has to transmit its latest received DMX data from ArtNet onto the DMX outlets. The output time can be set continuously or from 1 – 10 minutes.

- **Global settings**

The global settings contains the Profile Manager. Here you can recall and save complete routings and network settings into a profile.

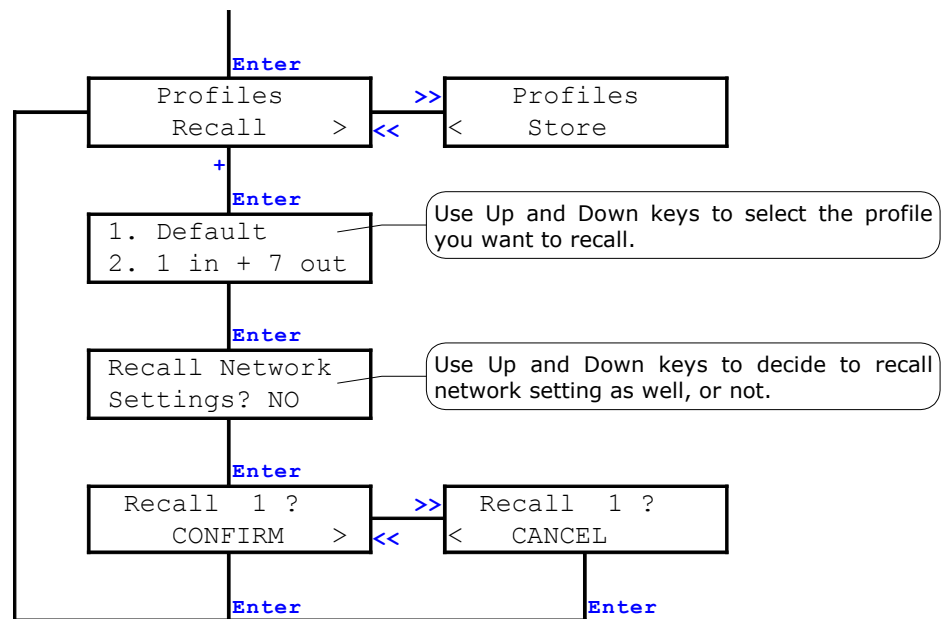

Space is provided to hold 40 different profiles. Already 11 most used profiles are provided with the firmware.

	Profile	Description
1	Default	All outlets as disabled output
2	1 in + 7 out	1 input at 0(00) and 7 outputs starting at 1(01) to 7(07)
3	All out 0	All outlets as single output starting at 0(00) to 7(07)
4	All out 8	All outlets as single output starting at 8(08) to 15(0F)
5	All in 0	All outlets as normal input starting at 0(00) to 7(07)
6	All in 8	All outlets as normal input starting at 8(08) to 15(0F)
7	1.7 Hub	1 input and 7 output all at 0(00)
8	2x1.3 Hub	2 inputs and 3 outputs for every input at 0(00) and 1(01)
9	4 x MergeHtp	4 x 2 merged inputs in HTP mode at 0(00) to 3(03)
10	4 x MergeLtp	4 x 2 merged inputs in LTP mode at 0(00) to (03)
11	4 x Backup	4 x 2 backup inputs at 0(00) to 3(03)

Recall profile

To recall a profile, follow the following procedure.

Choose *Global Set.*, *Profiles Recall* and press **Enter**.

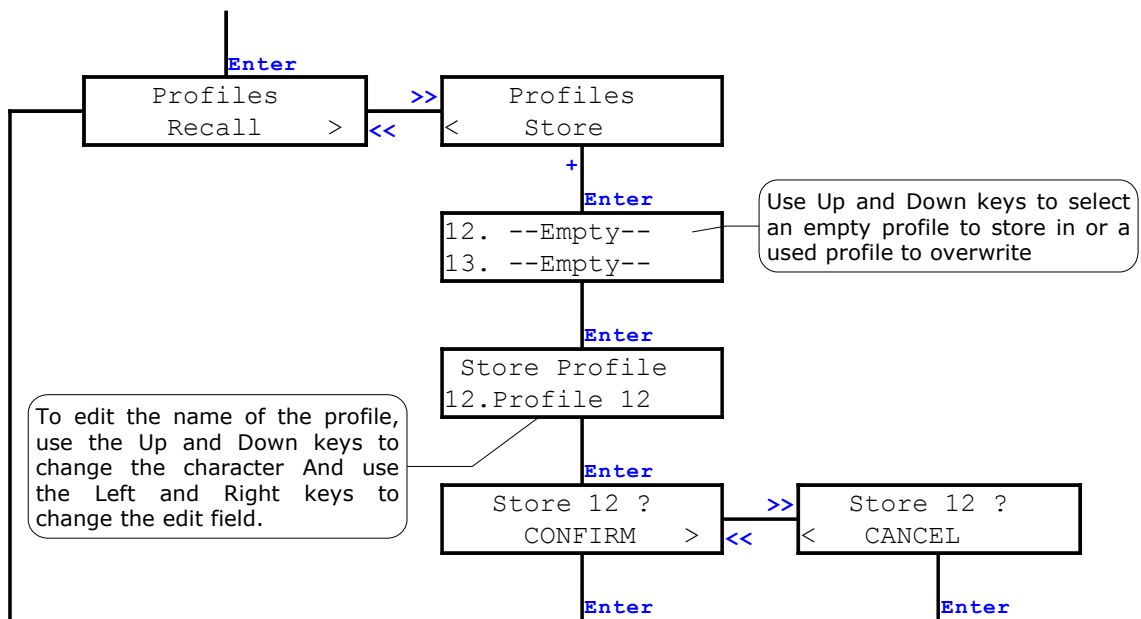

Choose the profile you want to recall. All empty profiles are marked like this: "--Empty--"

When recalling an empty profile, no changes will occur. The menu won't ask to confirm anything, it will only exit the recall menu.

When a valid profile is chosen the device will ask to recall network settings or not. When network settings are recalled, the IP and UDP port settings will be modified as well to default values. So if you do not want to touch you're already configured network setting say NO here.

Store profile

To store a profile, follow the following procedure.
Choose *Global Set.*, *Profiles Store* and press **Enter**.

Select an empty profile to store the profile, or choose the profile you want to overwrite.

When an empty profile is chosen, the device will ask to edit the profile name. By default it will come up with "profile " followed by the profile number.

When an already used profile is chosen the device will come with the existing name. You can edit the name or just go on by pressing enter.

When you want to save over an existing profile, you'll obviously see "OVERWRITE" instead of "STORE" in the confirm window. Be aware that overwritten profiles can't be recovered in any way.

Firmware version

This screen quickly display the firmware version running on the node.

This can be useful to check if you're running the latest version.

Visit our Web site to download the latest firmware : www.luminex.be

- **Status indication**

Four indication screens will rotate continuously on the display with an interval of a few seconds. The unit also returns to these root screens when no button is pressed for 2 minutes.

One of these screens shows the status of the configured outlets.

Screen	Description
<pre> Eth 12345678 < > </pre>	There is no outlet configured as input and there is no outlet outputting DMX data. All outlets are showing _
<pre> Eth 12345678 < i..... > </pre>	Outlet 1 is configured as a normal input. The status indication on outlet 1 will continuously change between ., i and I
<pre> Eth 12345678 < mh..... > </pre> <pre> Eth 12345678 < ml..... > </pre> <pre> Eth 12345678 < mb..... > </pre> <pre> Eth 12345678 < mc..... > </pre>	Outlet 1 is configured as Merged input together with outlet 2 in Htp mode. The status of outlet 1 will continuously change between ., m and M indicating MERGE. The status of outlet 2 will continuously change depending the mode of the merging: Htp: ., h and H Ltp: ., l and L Backup: ., b and B Custom: ., c and C
<pre> Eth 12345678 < o..... > </pre>	Outlet 1 is configured as a single (normal) output. The status indication on outlet 1 will continuously change between ., o and O
<pre> Eth 12345678 < z..... > </pre>	Outlet 1 is configured as a zero output (continuously outputting DMX zero values for all 512 channels). The status indication on outlet 1 will continuously change between ., z and Z

Web interface

Home

The complete device can be configured from an intuitive web interface. You just have to browse to one of the IP addresses mentioned in the root screen sequence.

Make sure that your computer, you use to browse, is setup in the correct network address range (IP 2.x.x.x or 10.x.x.x and subnet 255.0.0.0).

When you're not using a complete network setup (Ethernet switches, hubs, routers, WLAN, ...), you can also use a cross Ethernet cable to directly connect to one unit.

After all connections and setup on the computer are completed, open your favorite web browser and enter the IP address you want to reach in the URL field.

[Http://2.0.0.2/](http://2.0.0.2/)

The screenshot shows the Luminex web interface in a Firefox browser window. The browser's address bar contains the URL <http://2.0.0.2/>. The interface has a dark blue theme with a sidebar on the left containing navigation options: Status, Set up (with sub-items node 1, node 2, global), Toolbox (with sub-items profile manager, firmware upgrade), and Help. The main content area is titled 'Status' and is divided into three sections: DMX Routing, Global Settings, and Network Settings. The DMX Routing section contains a table with 8 rows, each representing an outlet. The Global Settings section lists various parameters like ID No, Trigger universe, and DMX details. The Network Settings section compares settings for Node 1 and Node 2. Three white callout boxes with black text point to specific parts of the interface: 'Navigation Bar' points to the sidebar, 'Actual DMX routing' points to the DMX Routing table, 'Actual Global settings' points to the Global Settings section, and 'Actual Network settings' points to the Network Settings table.

	Direction	Universe	Mode	IP Merge	Legend	Unicast	Info
Outlet 1:	output	000 (0x00)	disabled	disabled	Outlet 1	NA	
Outlet 2:	output	001 (0x01)	disabled	disabled	Outlet 2	NA	
Outlet 3:	output	002 (0x02)	disabled	disabled	Outlet 3	NA	
Outlet 4:	output	003 (0x03)	disabled	disabled	Outlet 4	NA	
Outlet 5:	output	004 (0x04)	disabled	disabled	Outlet 5	NA	
Outlet 6:	output	005 (0x05)	disabled	disabled	Outlet 6	NA	
Outlet 7:	output	006 (0x06)	disabled	disabled	Outlet 7	NA	
Outlet 8:	output	007 (0x07)	disabled	disabled	Outlet 8	NA	

Global Settings

ID No: 001
Trigger universe: Disabled
DMX details:
→ framerate: 36 Fps
→ break: 92 µS
→ MAB: 20 µS
→ output time: continuously

	Node 1	Node 2
IP:	2.0.0.2	2.0.0.3
Netmask:	255.0.0.0	255.0.0.0
Port:	0x1936	0x1936
Short name:	Node 1	Node 2
Long name:	Node 1	Node 2

You'll end up at the status page of the device. This page has a complete overview of the device its settings.

The overview shows the actual DMX and network setting / routing of the complete device.

Setup

Choose one of the items in the sub menu to setup the device.

Once in a setup page, help is available on almost every field title. Just click on the question mark next to the topic. A pop up frame will display the overall information of each term displayed on the Web interface.

- **Node 1 & 2**

To setup node 1 or 2 click on the appropriate sub menu item in the Setup navigation bar (Node 1, Node 2).

Node 1 is to setup outlet 1 to 4 and node 2 to setup outlet 5 to 8. This is indicated on top of the page.

This is the one of the main settings page. You can setup every single outlet of the node 1 , as input or output. Select the outlet's direction, mode and universe. Here you can also change the IP address, Netmask, port and the ArtNet short and long name indication.

Same settings are available for outlets 5 to 8 by clicking on "Node 2" in the left navigation menu.

- **DMX Routing**

To better understand the use of all features, let's define each category of this menu:

Direction : Set the direction you need to the outlet, either Input or Output. Depending your selection, some features won't be available in the other categories.

Universe : Select the universe number. The left column number represents the decimal value, the right column number the Hexadecimal one. Setting the universe number through Web interface avoids the user to set Subnet and subswitch settings separately.

Mode : According to the direction you set on the outlet, this menu offers several mode :

Input : Disabled : Outlet is disabled, better for node performance.
 Normal : Outlet set as normal input
 Merge : Allow to merge 2 DMX streams.

When an odd outlet is configured as a merged input (1,3,5,7), the corresponding outlet (2,4,6,8) will be automatically set as input as well.

Output : Disabled : Outlet is disabled, better for node performance.
 Zero : Send all channels with a zero value (for maintenance only)
 Single: Normal output.

IP Merging : This special feature allows you to merge 2 different DMX or Artnet streams through the network. The merging policy will be mainly applied on the DMX Output, except for IP backup.

Legend : Set a legend to the outlet, useful to remind yourself what's connected to that outlet.

Unicast : Artnet is a broadcast protocol, which means that each packet sent from a single source will be received by all actives equipment on the network. Unicast provides you to cast you data to a selected IP address, resulting in a lower use of bandwidth.

All setting that are not applicable for the actual setting will be grayed out or marked as N/A (Not Applicable).

- **Merging Policies :**

The Ethernet-DMX 8 firmware offers enhanced merging policies that fits to all kind of setup, even the most complex one !

4 available merging policies can be applied on your DMX network, in 2 main setup categories :

Local merging : 2 different DMX streams are merged on the same physical device (Node). The merging policy will be mainly set on Inputs.

Illustration 1: Local DMX merging

IP Merging : This special feature allows you to merge 2 different DMX or Artnet streams through the network. The merging policy will be mainly applied on the Output, except for IP backup.

Available policies :

- HTP : Highest Take Precedence; Commonly used to merge dimmer channels
- LTP : Latest Take Precedence; Better suited when using moving lights
- Backup : set one of the 2 outlets as a backup input
- Custom : This is the most complete and efficient policy. This mode offers you to choose what policy to apply for each channel of each universe, and also to create a complete custom soft patch. By more, the merging policy can be remotely triggered by DMX.

The available policies differs if you use either inputs or outputs :

Inputs (Local mode)

	Direction	Universe	Mode
Outlet 1	Input	0(00)	Merge
Outlet 2	Input	Ch1	HTP, LTP, Backup, Custom

In this example, the selected mode is "**Merge**". The second outlet will automatically be set as a merged input. You will not be able to configure a universe address for the second outlet, as the merged result will end at the universe address of the first outlet (primary input). Instead of universe you will be able to set the starting DMX channel address (1-512). This indicates from which channel address the second input has to be

merged in. This offset is only available when using **HTP** or **LTP** policies. Those rules will be applied on all channel of the universe.

If you choose "**Backup**", a small blue icon will appears on the left side of "Outlet 2" label; then click on it, a pop up frame appears :

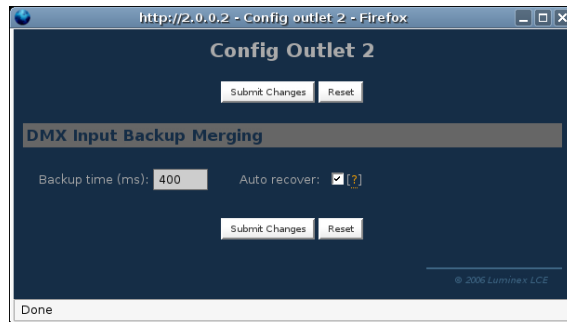

Illustration 2: DMX Input backup merging

This menu lets you choose the backup time (from 400 to 9999ms). This time represents the delay from which the node will automatically switch to the backup outlet when invalid or no DMX is received anymore on the primary outlet.

Tick the box if you want the node to auto-recover as soon as valid data is available again on primary connector.

If you tick off the box, you will have to enable the trigger universe and select a recover channel (page 34).

If you choose "**Custom**" policy, a small blue icon will also appear on the left side of "Outlet 2" label; then click on it, a new pop up frame appears :

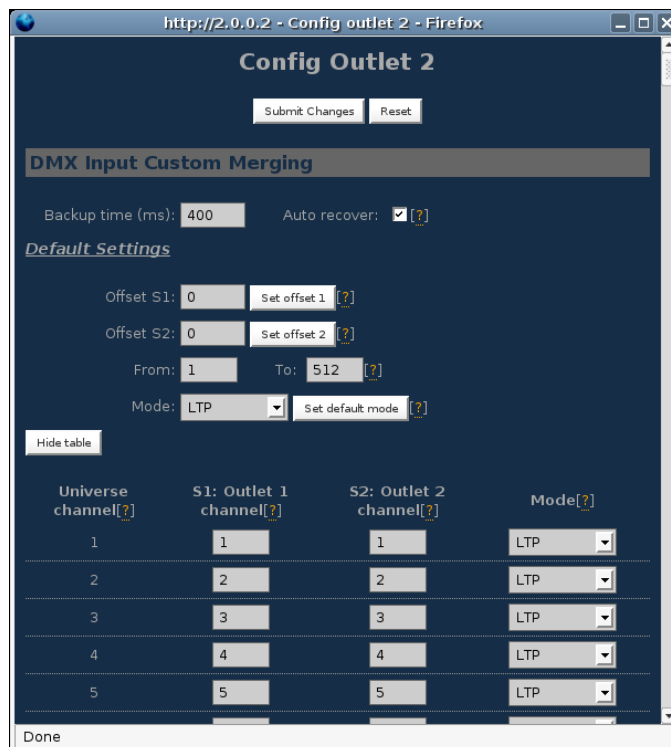

Illustration 3: Custom DMX input merging

Click on "**Show Table**" button to see the complete soft patch available for this outlet.

- **Offset S1 & S2** : Enter a value for the desired offset of the starting channel for outlets 1 or 2; example, for channels 1 to start on the third channel, enter 3.
- **From – To** : this range let you quickly set the policy you need on the channel range of your choice. example, if you need HTP policy on channels 23 to 145, enter 23 in the "**From**" field and "145" in the "**To**" field. Then select the HTP policy in the "**Mode**" drop down list, then press "**Set Default Mode**".
- Notice that following policies are available for each channel:

Zero, HTP, LTP, S1 only (Source 1 only), S2 only (Source 2 only), S1 as Backup (Source 1 as backup), S2 as Backup (Source 2 as Backup).

The left column represent the resulting universe channel number streamed to the network. S1 column represents Source 1 channels and S2 column source 2 channels. It's thus easy to understand that you can create your own soft patch by entering the channels of your choice in one of theses column.

Once your patch is created, click submit to close the window, then click submit again on the node page to record your settings.

Inputs (IP Merging)

	Direction	Universe	Mode	IP Merging
Outlet 1	Output	0(00)	Single	Disabled
Outlet 2	Output	1(01)	Single	Disabled
Outlet 3	Input	0(00)	Normal	Backup
Outlet 4	Input	0(01)	Normal	Backup

This mode can be very useful in such an application.

Illustration 4: IP Merging

The right side lighting desk is used as a backup desk on stage. This means that the right side node will automatically switch to theses outlets if no ArtNet packets are available on the selected universes (in that case universe 0 and 1). Select your backup time in the small pop up frame by clicking the left blue icon, then submit your changes.

Outputs (IP Merging)

	Direction	Universe	Mode	IP Merging
Outlet 1	Output		Single	HTP, LTP, Custom
Outlet 2	Output		Single	HTP, LTP, Custom
Outlet 3	Output	2(02)	Disabled	
Outlet 4	Output	3(03)	Disabled	

This mode can be very useful in the case of 2 control sources located in different places in the network wants to control the same DMX device in the same time.

Illustration 5: Output IP merging

In this setup, the right lighting software (S2) is used in the same time as the left lighting desk (S1). Both streams are merged through the final output on the right node.

The IP Merging mode provides the following policies when an outlet is set as output:

- HTP, for all outlet channels
- LTP, for all outlet channels
- Custom, to create a complete soft patch, to set merging policy for every single channel by IP source and to use the enhanced trigger system. Once Custom is selected, the universe number will disappear in the outlet's universe setting row.

If you choose "Custom", click on the blue icon left sided to the "Outlet" label. A pop up frame appears:

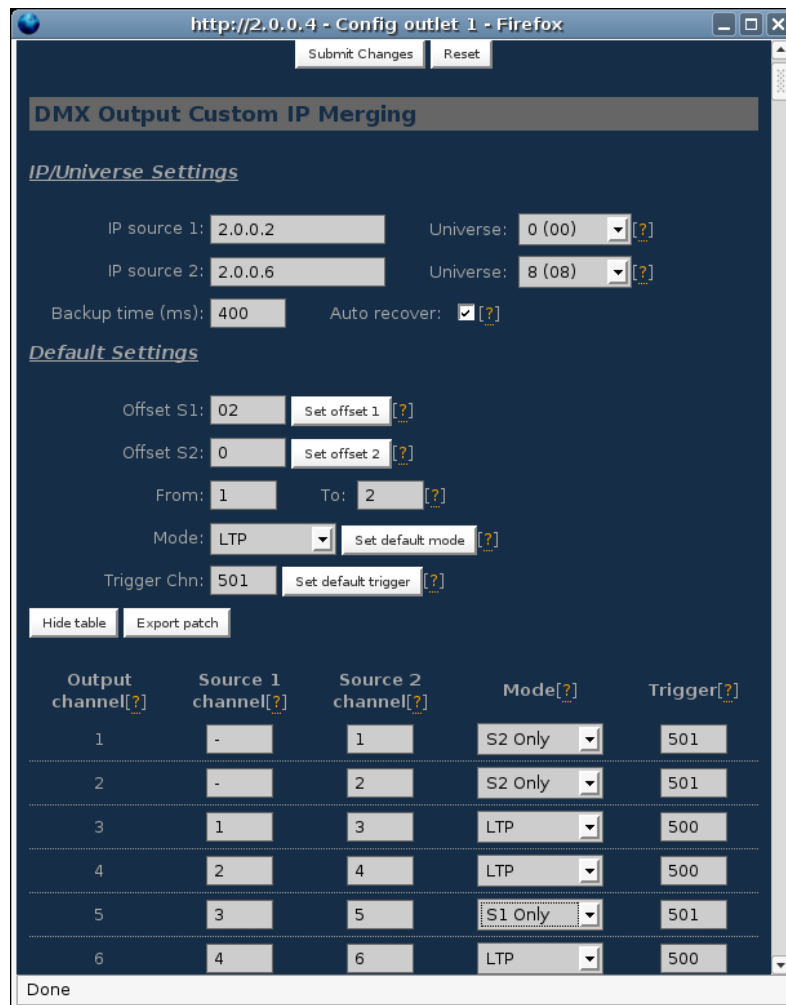

Illustration 6: DMX Output custom IP merging

You can find in this pop up frame similar features as when using the custom merging on outlets set as inputs (page 28).

The main difference is about the following points :

- **IP Source 1 & 2** : Here you can enter the 2 IP addresses assigned to your 2 control source. In case you don't know one of your source IP address, simply enter 0.0.0.0 in the address field.
- **Universe** : Here you can select the universes number streamed by your control source. This feature is very useful if the 2 sources don't use the same universe number.
- **Trigger channel**. This feature allows you to remotely change the merging policy of one or several dedicated channels through a single DMX value. From anywhere on the network, you can by example swap from a "LTP" merge to a "S2 only" policy simply by using a different DMX trigger channel value. Enter here the DMX channel you want to use to remotely takeover control of the merging rule. Once you've selected that channel, you'll need to reach the "Global" web page of the node to enable and select your Trigger universe. You'll also need to patch or assign a DMX trigger channel to your control source; here is the DMX chart of the Luminex DMX trigger channel :

0 - 7	Do nothing
8 - 15	Zero out
16 - 23	HTP merge
24 - 31	LTP merge
32 - 39	Source 1 only
40 - 47	Source 2 only
48 - 111	Reserved
112 - 119	Source 1 as backup
120 - 127	Source 2 as backup
128 - 255	Do nothing

Note :Never forget if you control the trigger channel from more than one source to press “Do nothing” once you've selected the desired value. Indeed, if you send 2 different values from 2 different sources for the trigger channel, the node won't stop swaping between those values, what results in a big slowing down of the node processing power.

Recover channel

If you have set one of a node outlet in IP backup mode, the node will swap automatically to this outlet in case of DMX failure from the primary source. Once the primary source is back again available, the node will automatically swap back to that source if set in Auto-recover mode. We all know that it can be useful to decide when to swap back to the primary source (booting time of the desk + loading the right cue in case of desk failure). Tick off the auto-recover box in the pop up window if you decide to work in manual recover mode. Then you'll have to enable the trigger universe in the “Global” Web page and choose a recover channel. You now have the opportunity to choose to recover whether each outlet one by one or all outlet in one shot.

Here is the Luminex recover channel DMX chart :

0 - 7	Do nothing
8 - 15	Recover outlet 1
16 - 23	Recover outlet 2
24 - 31	Recover outlet 3
32 - 39	Recover outlet 4
40 - 47	Recover outlet 5
48 - 55	Recover outlet 6
56 - 63	Recover outlet 7
64 - 71	Recover outlet 8
72 - 79	Recover all outlets
80 - 255	Do nothing

Patch files :

All those soft patches can be recorded or loaded from or to the node by using “Load Patch” or “Export patch” buttons. Luminex node recognize .txt files. These are “TAB” separated files which can be edited using spreadsheet software (Excel, OO Calc,...)

Network settings

The screenshot shows a web browser window titled "Node 1 - Setup" with the URL "http://2.0.0.2/cgi-bin/setup_node.cgi?node=1". The page is for "Luminex Lighting Control Equipment" and is titled "Set Up:: Node 1 (outlet 1 - 4)".

DMX Routing

Message:

	Direction [?]	Universe [?]	Mode [?]	IP Merging [?]	Legend [?]	Unicast [?]
Outlet 1	Output	0 (00)	Disabled	Disabled	Outlet 1	
Outlet 2	Output	1 (01)	Disabled	Disabled	Outlet 2	
Outlet 3	Output	2 (02)	Disabled	Disabled	Outlet 3	
Outlet 4	Output	3 (03)	Disabled	Disabled	Outlet 4

Network Settings

IP Settings

ArtNet compliant? [?]

IP: 2.0.0.2 [?]

Netmask: 255.0.0.0 [?]

Broadcast: 2.255.255.255 [?]

Port (Hex): 1936 [?]

Node Identification

Short name: Node 1 [?]

Long name: Node 1 [?]

IP Settings

You can enter here the desired ArtNet IP address and Netmask you want to use. If you're not confident with ArtNet IP setting, tick the "ArtNet compliant?" box for the node to warn you in case of mistake. ArtNet IP addresses usually look like 2.x.x.x or 10.x.x.x.

You're not obliged to work with ArtNet IP addresses. If you wish to work with usual IT IP addresses as 192.168.x.x, there's no problem for you to set such address on the node. Please remember that your node will thus not be visible on the network from devices set with conventional ArtNet IP addresses (2.x.x.x or 10.x.x.x).

The Port field allows you to change the UDP port used on the network to transmit your UDP ArtNet packets. Luminex recommends not to change this value.

Node identification :

Enter here a small and long name to easily identify your node on the network through a Web interface, ArtNet compliant softwares or Luminex LumiNet monitor.

- **Global**

Some global settings can be altered by clicking Global in the Setup sub menu. Device Settings

Here you can change the device's ID number which is indicated on LumiNet monitor.

You can also enable the Trigger universe to remotely control your merging policy through any DMX source. The node will listen to the specified universe entered in the universe field.

You can set your Recover channel if you use the manual recovery mode (page 28, 32).

DMX details

The DMX frame rate setting for all outlets. This can be set from 20 to 44 frames per second.

DMX Break time can be set from 92 – 352 us

DMX Mark After Break (MAB) time can be set from 12-88 us

DMX Output time can be set to 1 – 10 minutes or continuously. This time sets how long an output remains outputting it's last DMX levels after no valid DMX packet came in for that particular universe on ArtNet.

Miscellaneous

This part is about security and warnings :

- **Verbose level** : Select if you want to see error messages on the front end OK LED.
- **Lock Mode**: select the security level you want to be applied on your Node 2 front end. Auto lock will force the Node to lock all wheels encoders and switches after 2 minutes of front end inactivity.

Password protected mode will guide you to set a password into the "locking code" field. Once the node is locked, you'll have to enter the 4 digit password through front end buttons or through Web interface password field.

Read the "Unlock the node" chapter to see the complete procedure.

Toolbox

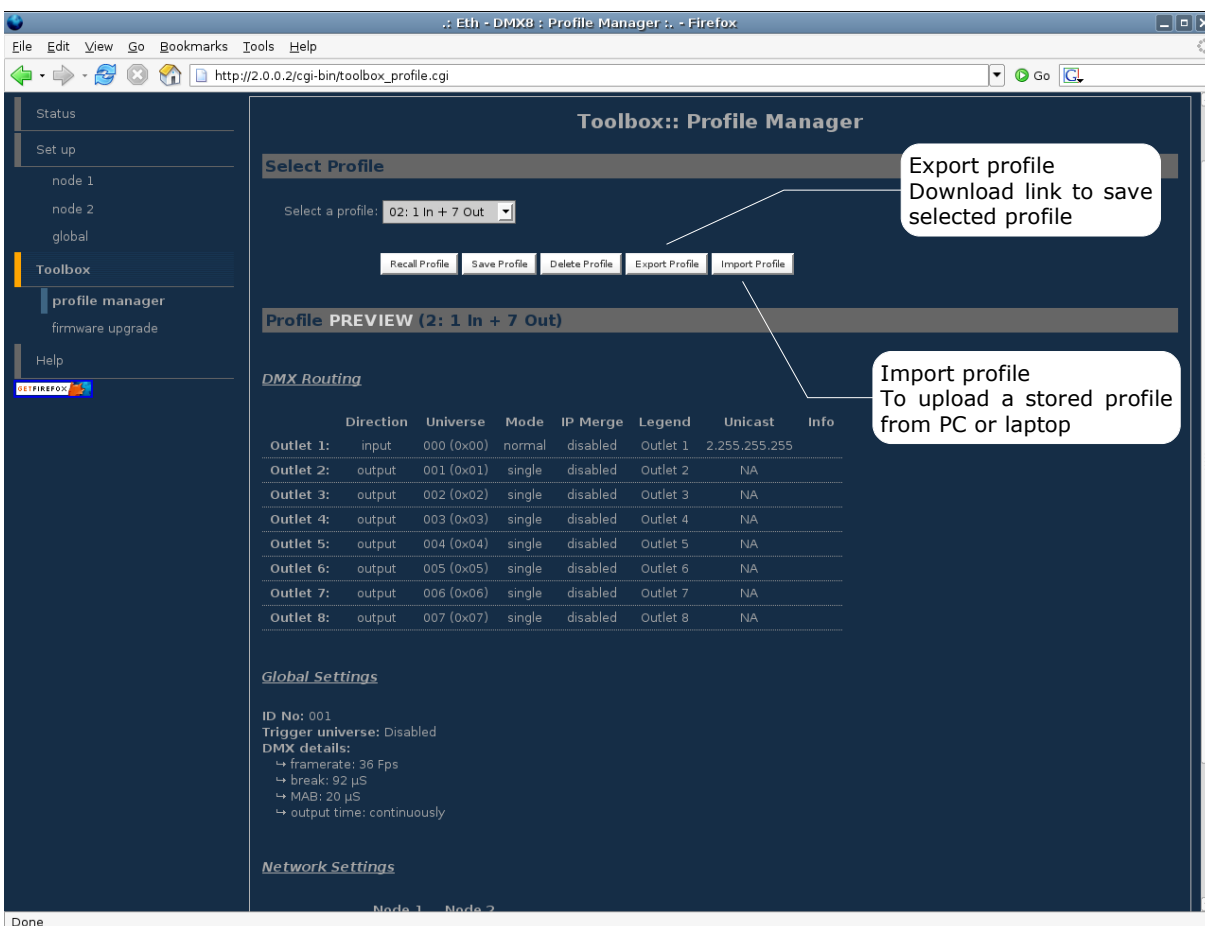

When clicking on Tools in the navigation bar, a sub menu appears. Choose one of the items in the sub menu.

- **Profile manager**

The profile manager is able to store 40 profiles. All profiles are stored on the device.

A preview of the complete configuration stored in a profile is shown when a profile is selected from the drop down list. When an empty profile is selected, no preview will be shown.

Once a profile is selected you can choose to recall it, to save actual settings as a profile, or to delete the profile.

When recalling a profile, an other page will appear to ask whether to recall your network settings as well or only the outlet routings.

When saving a profile a next page will ask you to fill in a profile name.

- **Firmware upgrade**

The firmware upgrade page allows you to select a downloaded firmware file and upload it to the device.

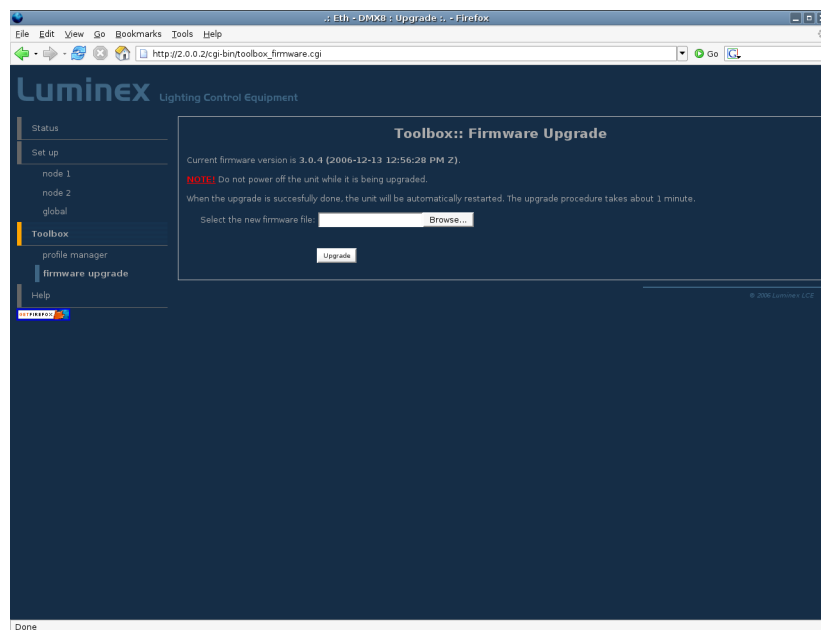

This page shows the actual firmware version running on the unit below the file upload field.

The latest firmware file can always be downloaded from the Luminex web pages.

[Http://www.luminex.be](http://www.luminex.be)

To install the firmware on the Ethernet-DMX8 follow these steps:

1. Download the .zip file and save it on your hard disk.
2. Extract the .zip file.
3. Please read the "ChangeNote.txt" for latest release changes.
4. Browse to the device its IP address with your favorite web browser.
5. Click Toolbox -> Firmware upgrade.
6. Browse to the extracted upgrade file on your hard disk (upgrade_eth_dmx8.tgz).

7. Select the file and press on the "Upgrade" button.
8. The upgrade file will be sent to the device.
9. Wait until the device has rebooted.
10. Enter the IP number of the device in your browser and check at Toolbox -> Firmware upgrade if the current version is set to the right version number. If the number is the same as mentioned with the file than the upgrade has succeeded.

Additional Documentation

All additional documentation can be downloaded from our web pages in the support section.
